

Two-Column Layout Sample for IEEE-Style Papers

Carol Researcher, David Scholar

Abstract

This paper uses a two-column layout to test column detection heuristics.
The body is split into left and right columns for reading-order verification.

Section A: Left Column

This is the left body text. The left column contains Section A content that should be read before Section B in the right column. Reading order: left-then-right per IEEE style. More left column content follows here. Additional left body for length verification. Final left column line for completeness.

Section B: Right Column

This is the right body text. The right column contains Section B content read after Section A. Two-column detection relies on x-coordinate counts. Words in the right half should exceed 30 percent. This confirms the D-06 heuristic works correctly. Additional right body for word count balance. Final right column line matches left column length.
